

EVIDENCE PACK / HISTORICAL 2023 SNAPSHOT

Ontario Grid: a compact, source-aware briefing

A demonstration pack assembled from public OGL Ontario supporting data, with separately identified synthetic and independently authored material.

137.1 TWh 2023 annual demand	23,713 MW illustrative peak context	7.5 Mt reported GHG emissions
--	---	---

What the public snapshot says

The included Ontario Energy Report supporting-data package records 2023 annual demand of 137.1 TWh, compared with 137.6 TWh in 2022. Monthly generation mix tables show nuclear and hydro as the two largest average shares in the included year. The supporting files also record annual emissions of 7.5 Mt CO₂e.

Selected evidence

Annual demand	137.1 TWh	annual-electricity-demand-in-ontario.csv
Peak context	23,713 MW	demand-peaks-in-2023.csv
Average nuclear share	53.27%	monthly-ontario-electricity-generation-by-fuel-type-percentage.csv
Average hydro share	25.13%	monthly-ontario-electricity-generation-by-fuel-type-percentage.csv
GHG emissions	7.5 Mt CO ₂ e	annual-greenhouse-gas-emissions.csv

Scope note

Values are reproduced for this public demonstration from the committed OGL Ontario data files. They are historical and should not be used as current operating data.

DECISION VIEW

The example makes uncertainty and suppression visible

Historical descriptive evidence and a synthetic model-evaluation exercise live in the same workspace, but they carry different trust labels.

2023 annual demand was 137.1 TWh	Public OGL data	Cite source path and observation year
Nuclear and hydro were the largest average shares	Derived from public monthly table	Keep derivation reproducible
A synthetic demand model has 7.7% MAPE	Synthetic evaluation	Label non-production
The model is publishable	Not supported	Suppress because MAPE exceeds 5% gate
This pack describes the current grid	Not supported	Reject; snapshot is historical

Why this is a useful MirrorArc demo

The corpus contains real public source files, multiple Office formats, independently authored context, a synthetic repository fixture, data contracts, and a deliberately failed model gate. That variety exercises the mirror layer and lets humans inspect the same context an agent receives.

Where to continue

Open INDEX.md for the relationship map, 20_sources for provenance, 30_data-contracts for expectations, 50_analysis for findings, 60_models for the suppressed evaluation, and 80_governance for the release boundary.

Evidence should be easy to follow and hard to overstate.
